ZACRP4 protein has two complement factor C1q domains. The ZACRP4 gene is located on human chromosome 11q11. The ZACRP4 coding sequence and protein have a number of uses described in the specification, including, modulatation of energy balance and cellular metabolic reactions in mammals. In addition, ZACRP4 protein is useful as an autocrine factor, particularly during development, in mediating the processes of an organism, in regulating cellular processes such as cell proliferation and/or differentiation, cell survival and energy balance.

                                                                                                                                                                                                                                                                                                                     CC (SECP1-24), proteins 90% identical to them and active fragments of them. CC (SECP1-24), proteins 90% identical to them and active fragments of them. CC Also included are nucleic acids encoding the SECP proteins, a recombinant CC polynucleotide comprising a promoter sequence operably linked to the conclusion acid, a cell transformed with the recombinant polynucleotide, and creating for anti-gonists and modulators of anti-SECP antibody, and screening for anti-gonists and modulators of CC SECP function or expression. The SECP proteins and nucleic acids are cuseful in the diagnosis, treatment and prevention of cell proliferative (e.g. actinic keratosis, arteriosclerosis, burstiis, hepatitis or CC cander), autoimmune/inflammatory (e.g. AIDS (acquired immunodeficiency CC syndrome), asthma, anaemia, allergies or atopic dermatitis), CC cardiovascular (e.g. congestive heart failure, ischaemic heart disease, compocation, hypertensive heart disease, or vascular tumours), CC meurological (e.g. epilepsy, stroke, cerebral meoplasms, or Alzheimer's CC syndrome, Duchenne and Becker muscular dystrophy, or hypothyroidism) CC diseases, many other diseases and disorders are listed in the

The invention is CC useful for treating or preventing a NOVX-associated disorder such as CC cardiomyopathy or atherosclerosis, where the disorder is related to cell signal processing and metabolic pathway modulation in a subject, CC preferably human. The invention is also useful for treating metabolic disorders (e.g. obesity), diabetes, infectious disease, neurodegenerative CC disorders (e.g. Alzheimer's disease, Parkinson's disease), immune CC disorders, haematopoietic disorders and various cancers. The molecules of the invention are also useful for treating or preventing cirrhosis, CC pancreatitis, learning and memory defects, infertility, congenital heart CC defects, acne, hair growth, pigmentation disorders, endocrine disorders, respiratory disease, gastro-intestinal diseases, reproductive, health, CC neurological diseases, some marrow transplantation, endocrine diseases, CC allergy and inflammation, nephrological disorders, uninary system CC disorders, neuropsychiatric disorders and age-related disorders.

signal processing and metabolic pathway modulation in a subject, preferably human. The invention is also useful for treating metabolic disorders (e.g. obesity), diabetes, infectious disease, neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disease), immune disorders, haematopoietic disorders and various cancers. The molecules of the invention are also useful for treating or preventing cirrhosis, pancreatitis, learning and memory defects, infertility, congenital heart defects, acne, hair growth, pigmentation disorders, endocrine disorders, respiratory disease, gastro-intestinal diseases, reproductive, health, neurological diseases, bone marrow transplantation, endocrine diseases, allergy and inflammation, nephrological disorders urinary system disorders, neuropsychiatric disorders and age-related disorders. The present amino acid sequence represents a NOVX protein of the

The present invention relates to new NOVX polypeptides. The invention is useful for treating or preventing a NOVX-associated disorder such as cardiomyopathy or atherosclerosis, where the disorder is related to cell signal processing and metabolic pathway modulation in a subject, preferably human. The invention is also useful for treating metabolic disorders (e.g. obesity), disbetes, infectious disease, neurodegenerative disorders (e.g. Alzheimer's disease, parkinson's disease), immune disorders, haematopoietic disorders and various cancers. The molecules of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         haematopoietic disorder; cirrhosis; pancreatitis; learning defect; memory defect; infertility; congenital heart defect; hair growth; pigmentation disorder; endocrine disorder; respiratory disease; health; gastro-intestinal disease; reproductive; neurological disease; bone marrow transplantation; endocrine disease; allergy; inflammation; nephrological disorder; urinary system disorder; age-related disorder; neuropsychiatric disorder; EGF-related protein; SCUBEL; TEN-M4; adipocyte complement-related Clq tumour necrosis factor; out at first; beta adrenergic receptor kinase; Epha6/ehk-2; glucose transporter;
                                                                                                                                                                        Novel isolated NOVX polypeptide useful for treating cardiomyopathy, atherosclerosis, metabolic disorders, diabetes, obesity, infectious disease, anorexia, neurodegenerative disorders, Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                  29-AUG-2001;

Claim 20; Page 214-215; 1963pp; English

Cor polypeptides in a sample, and methods of identifying compounds which copypeptides of the invention. Although novel, many of the CO polypeptides of the invention have homology to known proteins, thereby complying an insight into their probable biological activities, and hence giving an insight into their probable biological activities, and hence compounds which the various activities, stem cell growth factor activity; differentiation activities, stem cell growth factor activity; chaematopoiesis regulatory activity; tissue growth activity; chaematopoiesis regulatory activity; tissue growth activity; chaematopoiesis receptor or ligand activities; or may be conditions, e.g., by brotein or gene there, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therepy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell vascular growth. Polypeptides involved with tissue regeneration and crepair (or nucleic acids encoding them) may be used to promote wound the haling (e.g., of burns, incisions and ulcers), while those with for preventing them may be used to promote to promote cell growth factor activity may be used in cell cultures to polypeptides may be used to neuroepithelial cells. Composed with provent factor activity may be used to neuroepithelial cells can be used to augment or replace cells damaged by illness, and in drug autoimmune disease or accidental damage. The polypeptides and nucleotides and mucleotides may also be used in the diagnosis of the above conditions, and in drug careanity techniques. The present sequence represents a novel buman in drug may also be used in the diagnosis of the above conditions, and in drug careanity techniques. antibodies against the polypeptides, or polypeptides in a sample, and meti nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising techniques. invention The present sequence represents a novel human a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                1587
